

389675 - PFCG File Format for Uploading Menus to User Roles

Component: BC-SEC-AUT-PFC (Basis Components > Security - Read KBA 2985997 for subcomponents > Authorization > ABAP Authorization and Role Administration), Version: 3, Released On: 04.12.2002

| Symptom

In the role maintenance transaction PFCG, on the Menu tab page there is a function Import from file.

What's the purpose of the function?

Which file format is used to upload a menu?

What's the difference to Download/Upload of roles?

Purpose

External products may like to send their menu description to the SAP System. These external product can produce a file containing the menu definition which should be uploaded into a role.

SAP doesn't deliver such a program.

File Format for Uploading Menus to User Roles

The menu is saved as a parent-child hierarchy. Each node in this hierarchy is identified by an object ID that only occurs once in the hierarchy.

Each object ID has a parent ID. If different object IDs have the same parent ID, the type of sorting determines the sequence of the nodes.

The root node of the structure is always the node with the number 1.

The root node does not have to be part of the structure in the file.

At least one node of the structure must have the parent ID "00001" to specify that this node hangs directly under the root node.

Character 1 - 20: name of record type

Record description or record type 'FORMAT'

Characters 21 - 40: Version of the format used in the file (left-aligned); the format described here is version 1.2B

Record description or record type 'NODE'

Characters 21 - 25: node object ID (right-aligned)

Characters 26 - 30: parent node ID (right-aligned)

Characters 31 - 35: sort sequence (right-aligned)

Characters 36 - 55: node type - FOLDER for folders,

- TRANSACTION for SAP transactions,

- URL for URLs

- KW for Knowledge warehouse links

- Your own node types if defined

Characters 56 - 310: node information for the node type

In case of node type FOLDER: no node information needed

In case of node type TRANSACTION: transaction code

In case of node type URL: URL

In case of your own node type: the node information

Record description for record type 'TEXT'

Characters 21 - 25: node object ID (right-aligned)
Characters 26 - 27: language for the text of this record in ISO standard(for example EN = English, FR = French, DE = German, ...)
Characters 28 - 107: text in the language specified in characters 26 - 27

Example
You want to import a hierarchy that contains five nodes consisting of four different types with text in three languages. You have defined your own node type YOUR_OWN_TYPE and specified the function modules for the functions of this node type.

Note: Defining your own node type is optional and is used to copy data from external products to SAP roles - up to 255 bytes per node. If you do notdefine your own node type, you can use the node types supplied by SAP. SAP currently supplies four node types: FOLDER (for the menu hierarchy), TRANSACTION (for SAP transactions), URL (for URLs), and KW (for knowledge warehouse links).

Naming convention for node types: Y, Z, or a licensed namespace /../ prefix for customer developments or partner developments.

Example (see file attachment):
Root node (ID 1 - not part of the file)
|
|-- Node A (ID 2 - node of type "YOUR_OWN_TYPE")
|
|-- Node B (ID 3 - node of type "FOLDER")
|
| |-- Node C (ID 4 - node of type "YOUR_OWN_TYPE")
| |
| |-- Node D (ID 5 - node of type "URL"
| | for example, a static URL to the SAP workplace)
| |
| |-- Node E (ID 6 - node of type "TRANSACTION"
| | for example, transaction PFCG = role administration)

Difference to Download/Upload of roles
Download/Upload of roles is a complete different function.
(See note 181368)
